

This frame house is six bays wide and $2\frac{1}{2}$ stories tall, with a center gable projecting above the two central windows. Beginning on the left side, the second, fourth, and fifth bays contain a door, the center of which has four lights. The first, third, and sixth bays contain windows with two-over-two lights each. The second floor has six smaller windows, all with two-over-two lights, as does the center gable. The house is covered with its original clapboard siding, and rests on brick piers. The roof is covered with corrugated metal, and hangs over the gables, with return cornices. Two interior chimneys with chimney caps appear between the second and third bays, and just inside the end on the far right. That gable end contains two windows on each of the first two floors, and one, possibly two windows in the $\frac{1}{2}$ story. A shed-roofed addition appears behind the far right end of the house. How far across the back of the house this extends is unknown.
